More On Population

In an editorial on this page earlier this month, The Mining Journal raised some questions about the population of Marquette and Iron County. The editorial also raised some questions about the population projections for the future of the county. Both reports also indicated that the population could be underestimated, as the current population of the county is only 50,000 people.

The projections for the future of the county are based on the assumption that the current population will remain constant. However, it is possible that the population could increase in the future. The projections also assume that the county will remain a rural area, which is not necessarily the case. The population of the county could increase if the county becomes more urbanized.

The population projections are important because they are used to plan for future needs. For example, the projections are used to plan for the number of schools, hospitals, and other public facilities.

Norman Barrus, director of the MSEC Research and Statistics Division, has attempted to account for the discrepancies. In a letter to the editor, Mr. Barrus states, "Basically, both the Bureau of the Census and the MSEC use the population projections prepared by the University of Minnesota. If you compare the actual population counts for the entire United States to those of the Bureau of the Census, you will find that the differences between the two agencies are not as large as they might appear. This is because the differences are not as large as those between the Census and the MSEC.

It is possible that the population projections for the future of the county could be underestimated. However, it is not possible to say with certainty that the population will increase in the future. The population projections are based on assumptions that may not be accurate.

The population projections are important because they are used to plan for future needs. For example, the projections are used to plan for the number of schools, hospitals, and other public facilities.

In conclusion, it is important to consider the population projections when planning for future needs. However, it is not possible to say with certainty that the population will increase in the future. The population projections are based on assumptions that may not be accurate.
